Orders

Suppose you are a backend developer at a startup. You are given an unsorted list of orders based on timestamp epoch. Your task is to Sort these orders based on timestamp epoch and then search for a particular order arrived at a specific time.

You are already provided with a boilerplate code, which takes care of everything. You just have to complete the Merge sort and Binary search methods.

Each record in Orders db is in format : [epoch_timestamp, order_id, price]

Tasks

-- Complete merge_sort_orders method. Your code should sort the db based on timestamp epoch.

-- Complete binary_search method. Your code should search the sorted db for a particular timestamp epoch.
